Dear user,

You have been provided with a ZIP archive which contains the PCT utility (Partner Customization Tool), an example of the configuration file, and the Usage_Agreement.txt file.

To use the utility and customize the distributive, you first need to edit the configuration file.

Configuration file example:

```
{
"COMPANY_NAME": "PARTNER inc.",
"SMTP_SERVER": "127.0.0.1",
"SMTP_PORT": "25",
"ADMIN_EMAIL": "admin-custom@admin.ru",
"SENDER_EMAIL": "sender-custom@sender.ru",
"CONNECTION_SECURITY": "0",
"NEED_AUTHENTICATION": "1",
"EMAIL_USER": "smtp_login",
"EMAIL_USER_PASSWORD": "smtp_password",
"GETPREMIUM_LINK": "www.partner-link.com"
}
```

Where:
- **COMPANY_NAME** – the main parameter which is always required.
- SMTP settings can be omitted, but if at least one SMTP parameter is specified, then the presence of all the following SMTP parameters is required: SMTP_SERVER, SMTP_PORT, ADMIN_EMAIL, SENDER_EMAIL.
- If the NEED_AUTHENTICATION parameter is set to 1, then the EMAIL_USER and EMAIL_USER_PASSWORD parameters are required. The parameter is optional, 0 if not specified.
- For the CONNECTION_SECURITY parameter, 0 is for None, 1 – SSL\TLS, 2 – STARTTLS, the parameter is optional.
- GETPREMIUM_LINK – this link will be used for the Get Premium button in the customized application, the parameter is optional.
- All parameter names and values must be in double quotes, separated by colon, after each key-value pair there must be a comma (except for the last one) as in the example.

If you do not specify all the required parameters or specify the parameters incorrectly, the user will get an error when installing the customized application.

After saving changes to the configuration file, run the utility from the command line:

```
[utility file name].exe [name of distributive to customize].exe [configuration file name and extension] AGREETO_USAGE_AGREEMENT=1
```

All the specified files must be located in the same folder. The End User License Agreement which is provided alongside with the utility in the Usage_Agreement.txt file is accepted by setting the AGREETO_USAGE_AGREEMENT to 1. Your acceptance is mandatory to use the utility.

A command to start the utility may look as follows:

```
pct.exe KART_4.0.0.861.0.54.0_en-US.exe pct.json AGREETO_USAGE_AGREEMENT=1
```

As a result of the customization, the utility will delete the original distributive and save a customized distributive with the name of the original distributive in the same directory where the utility is located.

Depending on the parameter values that you specify in the configuration file, there may be the following changes in the behavior of a customized application (as compared to the behavior described in the Kaspersky Anti-Ransomware Tool for Business documentation):

1. The user will not be able to edit the Name and Position settings in the Email settings section in the customized application.

2. If the SMTP settings are specified in the configuration file, the following settings will be made in the customized application:

    a. application Mode = User (with email reports);
    b. The SMPT settings will be set from the configuration file. The customized application will send reports in accordance with those settings.
    c. Report schedule = Every day. Reports are sent automatically once a day, the first report will be sent at 12:00 the next day after the installation (local time on the user's device);
    d. Reports will contain the following information:

        • the company name from the configuration file;

        • the report period (product installation date — date of the current report generation);

        • the user's computer name (NetBIOS);

        • the IP address of the user's computer;

        • the name of the user's operating system;

        • information about detected objects (including about detections of legitimate software that can be used to damage data): the name of the verdict according to the Kaspersky Lab's classification (for example, PDM: trojan.Win32.Bazon.a), the name or IP address of the blocked host, path to the blocked application, date and time of detection, the result of processing the object.

    The user will not be able to view or change application Mode, SMTP, or Report schedule settings either during or after the installation.
